

Diabetes mellitus is a chronic medical condition where the body cannot properly process blood sugar which is also known as glucose. The primary types of diabetes include type one where the immune system attacks insulin producing cells and type two where the body becomes resistant to insulin or does not make enough of it. There is also gestational diabetes which occurs during pregnancy. Common symptoms often include increased thirst frequent urination unexplained weight loss fatigue and blurred vision. Remedies and management strategies involve maintaining a healthy diet engaging in regular physical activity monitoring blood glucose levels and sometimes taking medications or insulin injections as prescribed by healthcare professionals. Proper management is essential to prevent long term complications such as heart disease nerve damage and kidney failure.
